

Realize the Potential of Nagios

Reduce complexity. Stop monitoring the monitors. Start focusing on the data and less on the administration.

AppFirst provides a scalable SaaS platform for managing your Nagios-compatible scripts.. By simply installing a lightweight collector, AppFirst automatically detects every running process and sends the output of all scripts to our HBase backend. This data is displayed in an intuitive UI, allowing users to create sophisticated alerts, perform root-cause analysis, and generate customized dashboards to visualize SLA's and metrics. It's the best of both worlds: open source customization without the hassle of configuration and management.

We think Nagios is a great tool and plays an important role in monitoring specific aspects of app performance. By layering Nagios scripts on top of our patent-pending in-process data, log files, system metrics, and instrumented StatsD metrics, AppFirst provides enterprises with a holistic view of their IT ecosystem. By gathering all this data in one place, companies are using AppFirst as a real-time operational navigation system.

Nagios shops are using AppFirst to lower hidden costs of:

- Expensive man-hours configuring Nagios to monitor your environments
- Extended MTTR due to scaled out, multi-tiered monitoring infrastructures
- Increased complexity throughout the data center

Leave your infrastructure monitoring to use. Focus on your critical apps

- Integrates with all 3,000+ Nagios plugins
- Reliability through world class AppFirst architecture
- Public /Private cloud ready

Ease of use

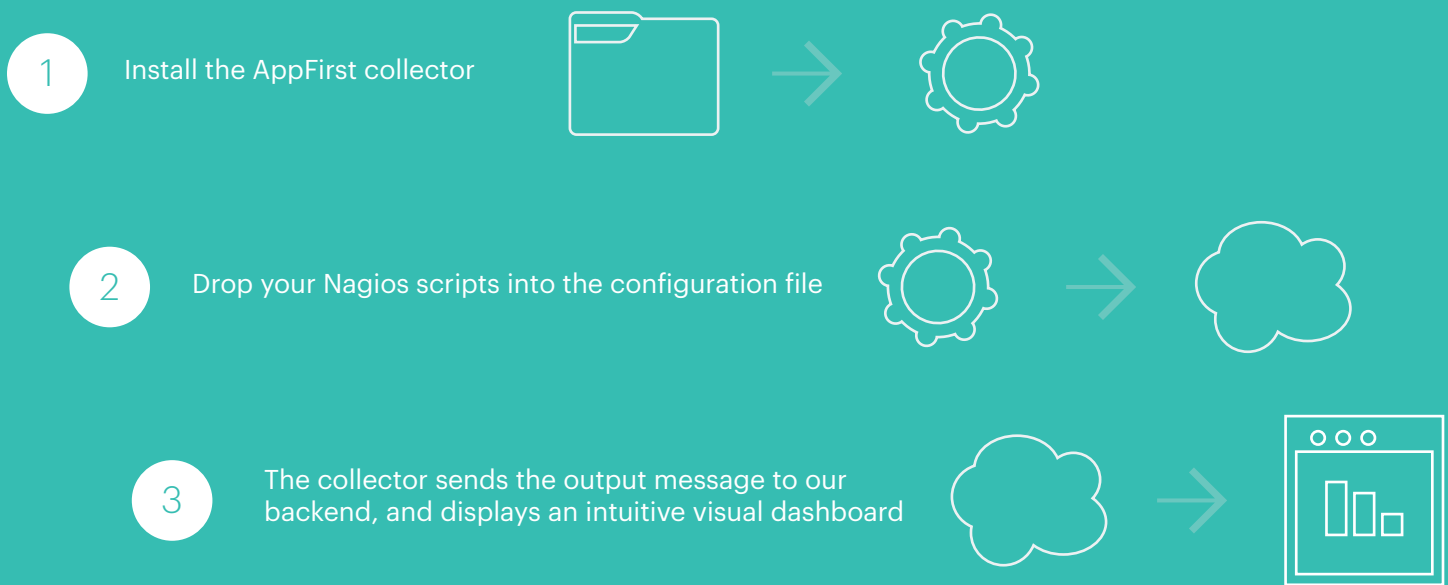

- Get started quickly. Drop in your scripts and start seeing data
- Beautiful and intuitive UI
- Automatically receive alerts on scripts with no additional configuration

Nagios Plugins + Log, Process, and StatsD data

- Correlate your scripted data with every other source
- Get to deterministic root cause with "miss nothing" data collection

How it Works

If you're already running Nagios scripts on your servers:

About AppFirst:

AppFirst delivers the only application and resource-aware operational intelligence platform that enables organizations to see key information across their entire IT ecosystem.

AppFirst's data collection and aggregation is a powerful Big Data solution, collecting data across every process within any application, across all servers, in real time. The data is then sent to our SaaS backend, allowing users to understand their data in a single, powerful view.

Customers are using AppFirst to lower IT costs, enhance security and compliance, make better business decisions based on proactive intelligence and drive toward a new quality of service.

As apps and the business grows, AppFirst easily scales to any size, accelerating agile IT operations through dynamic discovery.
